74	Električno pražnjenje Pored ručnih uređaja za pražnjenje tankova broda u pristaništu, ugrađen je električni sistem za pražnjenje u more. Električni sistem pražnjenja uključuje električni ventil sa tajmerom. Kada je pumpa uključena, vremensko odlaganje omogućava da se električni ventil otvori pre nego što se pumpa pokrene. Kada se pumpa isključuje ventil se zatvara. To znači da se ne mora svaki put kada se pumpa uključi, otvarati/zatvarati prohodni morski ventil. Prolazni morski ventil je sam po sebi opremljen mikro prekidačem koji sprečava rad pumpe kada je zatvorena. Električni ventil ima mogućnost ručnog prebacivanja Electric discharge In addition to the manual overboard and dockside discharge facilities an electric overboard discharge system is fitted. The electric overboard discharge system incorporates an electric valve with timer. When the pump is turned on a time delay allows the electric valve to open before the pump starts. When the pump is switched off the valve closes. This means the through hull seacock does not need to be opened/closed every time the pump is switched on. The through hull seacock is itself fitted with a micro switch which prevents operation of the pump when it is closed. The electric valve has a manual override facility	£ 3.905,00	*	£ 3.905,00
